Bruno Rodrigues

Organizational Context

SafeDrive Insurance is a mid-sized insurance company specializing in motor vehicle insurance. The company provides coverage for private and commercial vehicles across the entire country, serving both individual and corporate customers.

Over the past year, the number of claims submitted by policyholders has increased significantly. While the company has managed to process the higher volume of claims, customer satisfaction indicators have declined. Many customers report long processing times, unclear communication, and delays in receiving compensation.

The management team suspects that inefficiencies in the claims handling process may be contributing to these issues. The company requires your support to analyze and identify the current AS-IS situation.

The Process

The scope of this project is to understand and model the process followed when a customer submits a motor insurance claim after an accident. Once the claim is submitted, the system automatically registers the claim and assigns a unique claim number.

Claim Validation

When a claim handler receives a newly registered claim, the first task is to verify the policy information. The handler checks if the policy exists in the system, and if it exists, if the policy was active at the time of the accident. If any of the previous checks are not satisfied, the claim cannot proceed and, in these cases, the handler rejects the claim and sends a notification to the policyholder explaining the reason for rejection.

If all validation checks are successful, the claim moves to the next stage for damage evaluation.

Damage Evaluation

After validation, the claim handler determines whether a physical inspection is required. This decision depends on factors such as the type of damage, the clarity of the submitted photos, and the estimated severity of the accident. If a physical inspection is required, the handler assigns a company inspector to the claim. The inspector contacts the policyholder to schedule an inspection appointment and once the appointment is scheduled, the inspector performs the inspection and prepares an inspection report describing the damage. The report is then submitted into the system. If a physical inspection is not required, the claim handler evaluates the photos and description submitted by the policyholder.

After reviewing the available information, the claim handler estimates the repair cost and if the estimated repair cost is relatively low, the claim proceeds directly to the settlement stage.

However, if the estimated repair cost exceeds 1.500€, the claim must undergo an additional verification step to detect potential fraud.

Fraud Verification

When a claim requires fraud verification, the fraud analysis team reviews the claim details. During this stage, the team analyzes the policyholder's previous claim history, the characteristics of the current incident, and any suspicious patterns or unusual circumstances.

If suspicious elements are identified, the claim is escalated for manual investigation. During the investigation, additional information is requested from the policyholder. After the fraud team analysis of the new information, if fraud is confirmed, the claim is rejected, and the policyholder is notified about the decision, if fraud is not confirmed, the claim proceeds to the settlement stage.

If no suspicious elements are identified during the initial fraud verification, the process proceeds directly to the settlement stage.

Claim Settlement

After all required checks are completed, the claim handler approves the claim for payment, and the request is forwarded to the finance department. The finance department processes the payment and transfers the approved amount to the policyholder's bank account. Once the payment is completed, a notification confirming the payment is sent to the policyholder. The process ends after the payment confirmation is issued.

Deliverables:

- **Bizagi file: Model of AS-IS business process**, i.e., design a detailed BPMN process model reflecting the current state of the process.
